Darktrace & Microsoft:
Securing the Future of Work Together

Darktrace and Microsoft have partnered to help organizations enhance their cyber security across multi-cloud and multi-platform environments. Darktrace complements Microsoft's security with self-learning AI that detects and autonomously responds to novel cyber-threats that evade other defenses.

"Darktrace complements Microsoft's security products with AI and takes us to another level."

Enterprise-Wide Coverage

A series of new developments will help organizations in a number of critical areas:

AI email security: Antigena Email, Darktrace's self-learning email security technology, is now hosted on Microsoft Azure and listed on Microsoft Azure Marketplace.

Microsoft 365 SaaS Security: Self-learning threat detection and Autonomous Response across the full Microsoft 365 product suite.

Integration with Sentinel: A bespoke Workbook allows users to send and visualize Darktrace threat alerts and automated threat investigation reports inside Sentinel.

Endpoint protection: Darktrace's self-learning AI can now be applied to the rich endpoint data provided by Microsoft Defender.

Complementary Approaches to Cyber Security

As we enter a new era of cyber-threat, Darktrace and Microsoft are aligned in their approach to cyber security in many ways:

Multi-cloud, multi-platform: Cyber security has evolved in silos – with point solutions for email, endpoint, cloud, network, and so on. Modern defense requires a multi-platform, enterprise-wide approach.

Real-time detection: With machine-speed attacks like ransomware on the rise, stopping threats in their earliest stages is crucial to avoid damage and disruption.

Autonomous Response: Cyber security is now a machine fight, and human teams alone cannot keep up. Defenders need technology that not only detects but autonomously fights back against threats at machine speed.
